Object Hierarchy & Sharing Permissions

Object Hierarchy & Sharing Permissions – Example Details

You do not have to be a System Administrator to share permissions on objects to which you have access, but permissions on objects work within the access levels set by the System Administrator.

In other words, you have the ability to share or remove permissions to an object that you created or an object that was shared with you by another user.

When you are not the creator of an object, you must have SHARE access on the object that you want to share within your ACCESS LEVEL in addition to SHARE permissions on the object itself.

- You may only share the same level or a lower level of your own permissions on the object.
- You cannot share an object with a permission level higher than the access level of the user. For example, if a user has VIEW access to Projects as their access level, you cannot give them Manage permissions on a project.
- A user with permissions to at least VIEW an object can then share that object with someone else
- You can share objects with active users, job roles, teams, groups or companies
- You may only share objects with up to 100 entities it is recommended you share w/ the largest available option (teams, groups, etc.) to avoid running into this limitation
- You may also request permissions to an object from anyone that has SHARE permission to that object this comes in handy if someone sends you a link to an item that you cannot retrieve due to permission limitations
